Week 2-1: Primitive Data Types and Strings

Add WeChat powcoder

Giulia Alberini, Fall 2020

# WHAT ARE WE GOING TO DO IN THIS VIDEO?

- Primitive data types
- char
- String
- type conversion

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Assignment Project Exam Help

PRIMITIVE DATA  
TYPES

<https://powcoder.com>

Add WeChat powcoder

## PRIMITIVE TYPES

A **primitive** type is

- predefined by the language, and
- named by a reserved keyword

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Java supports 8 primitive data types.

## THE 8 TYPES SUPPORTED

byte

short

int

long

float

double

boolean

char

Integer values

Real Numbers

true or false

One character

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## HOW MANY VALUES?

How many values can you represent with:

- 1 bit?
- 2 bits?
- 3 bits?
- And what about  $n$  bits?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

$$2^n$$

## HOW MANY BITS?

And how many bits do you need to represent:

- 2 different values?
- 4 different values?
- 5 different values?
- And what about  $x$  different values?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

$$\lceil \log_2 x \rceil$$

➤ So, how many bits do you need to store a boolean?

HOW MANY BITS  $N$  DO WE NEED TO REPRESENT A POSITIVE INTEGER  $m$ ? —

Assignment Project Exam Help

$$m = \sum_{i=0}^{N-1} b_i 2^i$$

<https://powcoder.com>

Add WeChat powcoder

What is the relationship between  $m$  and  $N$ ?

# GEOMETRIC SERIES

Recall that,

Assignment Project Exam Help

$$\sum_{i=0}^{N-1} x^i = 1 + x + x^2 + x^3 + \dots + x^{N-1} = \frac{x^N - 1}{x - 1}$$

Add WeChat powcoder

That is, if  $x = 2$ ,

$$\sum_{i=0}^{N-1} 2^i = 2^N - 1$$

HOW MANY BITS  $N$  DO WE NEED TO REPRESENT A POSITIVE INTEGER  $m$ ? —

$$m = \sum_{i=0}^{N-1} b_i \cdot 2^i$$

Assignment Project Exam Help

$$m < 2^N$$

<https://powcoder.com>

$$\leq \sum_{i=0}^{N-1} 1 \cdot 2^i$$

Add WeChat powcoder

To solve for  $N$ , we take the log (base 2) of both sides and obtain the following equation:

$$= 2^N - 1$$

$$< 2^N$$

$$N > \log_2 m$$

Lower bound

## HOW MANY BITS $N$ DO WE NEED TO REPRESENT A POSITIVE INTEGER $m$ ? —

Now, let's assume that  $N - 1$  is the index  $i$  of the leftmost bit  $b_i$  such that  $b_i = 1$ .

e.g. We ignore leftmost 0's of the binary representation of  $m$ ,  $(\textcolor{red}{000000}10011)_2$

Assignment Project Exam Help

<https://powcoder.com>

Then,

$$m = \sum_{i=0}^{N-1} b_i 2^i = 1 \cdot 2^{N-1} + \sum_{i=0}^{N-2} b_i 2^i \geq 2^{N-1}$$

Add WeChat powcoder

Taking the log (base 2) of both sides,

$$\log_2 m \geq N - 1$$

$\Rightarrow$

$$N \leq (\log_2 m) + 1$$

Upper Bound

## HOW MANY BITS $N$ DO WE NEED TO REPRESENT A POSITIVE INTEGER $m$ ? —

We proved that,

$$\log_2 m < N \leq (\log_2 m) + 1$$

<https://powcoder.com>

Thus,  $N$  must be equal to the largest integer less than or equal to  $(\log_2 m) + 1$ .

We write,

$$N = \text{floor}((\log_2 m) + 1) = \lfloor (\log_2 m) + 1 \rfloor$$

where *floor* means "round down to the nearest integer".

## WHY DIFFERENT TYPES?

It turns out that the difference between the types storing integer values and real numbers is the number of bits reserved for those values. For more info: COMP 273

Description	Keyword	Size	Values
Very Small Integer	byte	8-bits	$[-128, 127]$
Small Integer	short	16-bits	$[-2^{15}, 2^{15} - 1]$
Integer	int	32-bits	$[-2^{31}, 2^{31} - 1]$
Big Integer	long	64-bits	$[-2^{63}, 2^{63} - 1]$
Low Precision Reals	float	32-bits	-
High Precision Reals	double	64-bits	-
True/False	boolean	1-bit	$[\text{true}, \text{false}]$
One character	char	16-bits	-

# OVERFLOW AND UNDERFLOW

- Variables of type `int` store values between  $2^{31} - 1$  and  $-2^{31}$ .

- $2^{31} - 1 = 2147483647$  (`Integer.MAX_VALUE`)

- $-2^{31} = -2147483648$  (`Integer.MIN_VALUE`)

Assignment Project Exam Help

<https://powcoder.com>

- What happens if: Add WeChat powcoder

```
int x = 2147483647;  
System.out.println(x+1);
```

Output:-2147483648

```
int y = -2147483648;  
System.out.println(y-1);
```

Output 2147483647

## STORING INTEGER AND OVERFLOW

Let's pretend that we only have 8 bits.

7 bits are used to store the number and the left most bit for the sign.

0 means positive and 1 means negative.

<https://powcoder.com>

01111111 = 127

What happens if we add 1?

## STORING INTEGER AND OVERFLOW

Let's pretend that we only have 8 bits.

7 bits are used to store the number and the left most bit for the sign.

0 means positive and 1 means negative.

<https://powcoder.com>

0111 1111 = 127

What happens if we add 1?

$$1000\ 0000 = -128$$

Note that negative numbers are stored a little bit differently. For more info see: [https://en.wikipedia.org/wiki/Two's\\_complement](https://en.wikipedia.org/wiki/Two's_complement)

## EXAMPLES

<https://powcoder.com>

Add WeChat powcoder

YouTube

Shared publicly - Dec 1, 2014

We never thought a video would be watched in numbers greater than a 32-bit integer (=2,147,483,647 views), but that was before we met PSY. "Gangnam Style" has been viewed so many times we had to upgrade to a 64-bit integer (9,223,372,036,854,775,808)!

Hover over the counter in PSY's video to see a little math magic and stay tuned for bigger and bigger numbers on YouTube.

## EXAMPLES

### Therac-25, radiation machine

- overflow during safety checks
- metal target would not be moved into place.
- result: beams 100 times higher than intended were fired into patients.
- 6 known cases causing the death of 4 patients.

low current  
electron beam  
was scanned  
across the field

Electron Mode

high current  
electron beam  
was tracked  
at the target

X-Ray Mode

high current  
electron beam  
with no target  
> 'lightning'

THE PROBLEM

tray including the target, a flattening filter, the collimator jaws and an ion chamber was moved OUT for "electron" mode, and IN for "photon" mode.

# FLOATING POINT

- In java the default floating point type is `double`.
- All standard arithmetic operations can be done on floating point.
- NOTE: Java distinguishes between `1` and `1.0`.  
If you write `.0` after an integer, it will be considered to be a `double`.

Add WeChat powcoder

```
int x = 3.0;
```

```
int x = 3;
```

```
double x = 3.0;
```

BE CAREFUL!

- Java automatically converts one type to the other (e.g. int to double) if need be AND if no loss of information would occur.

Assignment Project Exam Help

```
double x = 1; // legal, but bad style!
```

<https://powcoder.com>

- If the mathematical operators are used with at least one operand of type double, then java will convert the other operands to double and it will output a values of type double. BUT, if all the operands are integers, the output of the operator will also be an integer!!

Add WeChat powcoder

```
int x = 1.0/2; // compiler error!
```

```
double y = 1/4; // no compiler error, but is it correct?
```

CHAR  
Assignment Project Exam Help  
and  
<https://powcoder.com>  
UNICODE  
Add WeChat powcoder

## CHAR DATA TYPE

We have seen `char` as one of the primitive data types that we have in Java.

### Assignment Project Exam Help

- We can declare and initialize a variable of type `char` as follows:

<https://powcoder.com>

```
char letter = 'a';
```

Add WeChat powcoder

- Character literals appears in single quotes
- Character literals can only contain a single character

# ESCAPE SEQUENCES

- **Escape sequence:** a sequence of characters that represents a special character.
- **Examples:**
  - `\n` represents the character newline
  - `\"` or `\'` represent quotation marks
  - `\t` represents a tab.
- **Escape sequences are legal characters because they represent a single character**

```
char nl = '\n';
```

# UNICODE

---

- A character set is an ordered list of character, where each character corresponds to a unique number.

Assignment Project Exam Help

- **Unicode** is an international character set. Java uses Unicode to represent characters.

<https://powcoder.com>

Add WeChat powcoder

- Variables of type char have 16 bits reserved in the memory to store a value.
- Each character is represented by an integer.  
Note: not every integer represent a character!

# ASCII VS UNICODE

- ASCII: 7 bits. → It can represent 128 characters.

Assignment Project Exam Help

- UNICODE: 16 bits → 65536 characters.

<https://powcoder.com>

- It is a superset of ASCII: the numbers 0-127 map to the same characters both in ASCII and Unicode.

Add WeChat powcoder

# ASCII TABLE

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## CHARACTER ARITHMETIC

- Since every character is practically an integer, we can perform arithmetic operations on variables of type char.

```
char first = 'a';  
char second = (char)(first + 1);
```

Assignment Project Exam Help  
<https://powcoder.com>

- What is the value of second?

- 'b'

- Note the typecasting!

`first` is automatically converted into an integer, and `first + 1` evaluates to 98.

Then the typecasting converts the `int` into a `char`, and stores 'b' in `second`.

97	61	a
98	62	b
99	63	c
100	64	d
101	65	e
102	66	f
103	67	g
104	68	h
105	69	i
106	6A	j
107	6B	k
108	6C	l
109	6D	m
110	6E	n
111	6F	o
112	70	p
113	71	q
114	72	r
115	73	s
116	74	t
117	75	u
118	76	v
119	77	w
120	78	x
121	79	y
122	7A	z
123	7B	{
124	7C	
125	7D	}
126	7E	~
127	7F	[DEL]

## COMPARING CHARS

```
char letter = 'g';
if(letter == 'a') {
    System.out.println("First letter of the alphabet");
} else if (letter == 'z') {
    System.out.println("Last letter of the alphabet");
} else if (letter > 'a' && letter < 'z') {
    System.out.println("Another letter of the alphabet");
} else {
    System.out.println("Not a lower case letter of the alphabet");
}
```

**What prints?**

➤ Another letter of the alphabet

## TRY IT! - charRightShift

Write a method called `charRightShift` which takes a character and an integer `n` as inputs, and returns a character. If the character received as input is a lower case letter of the English alphabet, the method returns the letter of the alphabet which is `n` positions to the right on the alphabet. If the character received as input is not a lower case letter of the English alphabet, then the method returns the character itself with no modifications.

For example:

- `charRightShift('g', 2)` returns `'i'`,
- `charRightShift('#', 2)` returns `'#'`
- `charRightShift('z', 27)` returns `'a'`

Assignment Project Exam Help

TYPE CASTING

<https://powcoder.com>

Add WeChat powcoder

# TYPECASTING

- We can convert back and forth between variables of different types using **typecasting**. (or casting, for short)

Assignment Project Exam Help

```
int x = 3;  
double y = 4.56;  
int n = (int) y;  
double m = (double) x;
```

- What are the values of x, y, n, and m?

➤ x = 3, y = 4.56, n = 4, m = 3.0

## PRIMITIVE TYPE CONVERSION – INT ↔ DOUBLE

- When going from `int` to `double`, an explicit cast is NOT necessary.

<https://powcoder.com>

- When going from `double` to `int`, you will get a compile-time error if you don't have an explicit cast.

## PRIMITIVE TYPE CONVERSION – IN GENERAL

type	number of bits
double	64
float	32
long	64
int	32
char	16
short	16
byte	8

wider

narrower

*Here, wider usually  
(but not always)  
means more bytes.*

**NOTE:** *char is "special"...see the following slides.*

## EXAMPLES

```
int i = 3;  
double d = 4.2;  
d = i; // widening (implicit casting)
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## EXAMPLES

```
int i = 3;  
double d = 4.2;  
d = i; // widening (implicit casting)  
d = 5.3 * i; // widening (by "promotion")
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## EXAMPLES

```
int i = 3;  
double d = 4.2;  
d = i; // widening (implicit casting)  
  
d = 5.3 * i; // widening (by "promotion")  
  
i = (int)d; // narrowing (by casting)  
float f = (float) d; // narrowing (by casting)
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## EXAMPLES

```
int i = 3;
double d = 4.2;
d = i; // widening (implicit casting)
d = 5.3 * i; // widening (by "promotion")
i = (int)d; // narrowing (by casting)
float f = (float) d; // narrowing (by casting)
```

- For primitive types, both widening and narrowing change the bit representation. (See COMP 273.)
- For narrowing conversions, you get a compiler error if you don't cast.

## EXAMPLES WITH CHAR

```
char c = 'q';  
int x = c
```

Assignment Project Exam Help  
// widening

<https://powcoder.com>

Add WeChat powcoder

## EXAMPLES WITH CHAR

```
char c = 'q';
```

```
int x = c
```

```
// widening
```

```
c = (char) x;
```

```
// narrowing
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## EXAMPLES WITH CHAR

```
char c = 'q';
```

```
int x = c
```

```
// widening
```

```
c = (char) x;
```

```
// narrowing
```

```
short y = 12;
```

```
c = y;
```

```
// compile time error!! (need explicit casting)
```

```
y = c;
```

```
// compile time error!! Narrowing → need explicit casting
```

Assignment Project Exam Help

STRINGS

<https://powcoder.com>

Add WeChat powcoder

# STRING

- Recall that a `String` is sequence of characters.

Assignment Project Exam Help

- `String` is a **Class** and a string literal is an **Object**.  
(more on classes and objects in the following weeks)

Add WeChat powcoder

- We cannot use on Strings the same operators we use on primitive data types.
- There's a **set of methods** provided to manipulate characters and they can be called **on** values of type `String`.

# DOCUMENTATION

You can find it here:

<https://docs.oracle.com/javase/7/docs/api/java/lang/String.html>

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Methods	
Modifier and Type	Method and Description
char	<b>charAt</b> (int index) Returns the char value at the specified index.
int	<b>codePointAt</b> (int index) Returns the character (Unicode code point) at the specified index.
int	<b>codePointBefore</b> (int index) Returns the character (Unicode code point) before the specified index.
int	<b>codePointCount</b> (int beginIndex, int endIndex) Returns the number of Unicode code points in the specified text range of this String.
int	<b>compareTo</b> (String anotherString) Compares two strings lexicographically.
int	<b>compareToIgnoreCase</b> (String str) Compares two strings lexicographically, ignoring case differences.
String	<b>concat</b> (String str) Concatenates the specified string to the end of this string.
boolean	<b>contains</b> (CharSequence s) Returns true if and only if this string contains the specified sequence of char values.
boolean	<b>contentEquals</b> (CharSequence cs) Compares this string to the specified CharSequence.
boolean	<b>contentEquals</b> (StringBuffer sb) Compares this string to the specified StringBuffer.
static String	<b>copyValueOf</b> (char[] data) Returns a String that represents the character sequence in the array specified.
static String	<b>copyValueOf</b> (char[] data, int offset, int count) Returns a String that represents the character sequence in the array specified.
boolean	<b>endsWith</b> (String suffix) Tests if this string ends with the specified suffix.
boolean	<b>equals</b> (Object anObject) Compares this string to the specified object.
boolean	<b>equalsIgnoreCase</b> (String anotherString) Compares this String to another String, ignoring case considerations.

## COMPARING STRINGS

- To compare two strings you can use one of the following methods

boolean	<code>equals(Object anObject)</code> Compares this String to the specified object.
boolean	<code>equalsIgnoreCase(String anotherString)</code> Compares this String to another String, ignoring case considerations.

- `equals` is case sensitive, use `equalsIgnoreCase` if you don't want to distinguish between upper and lower case.
- Note that there's no keyword `static`!  
This means that the methods need to be called on a specific value/variable of type `String` and not on the name of the class (like, for instance, the method `abs` from the `Math` library).

## EXAMPLES

```
String course = "CMP 010";  
String course2 = "comp 250";  
boolean a = course.equals(course2);  
boolean b = course.equalsIgnoreCase(course2);
```

- The value of `a` is `false`
- The value of `b` is `true`

BE CAREFUL!

- If you try to use `String` you program will compile and run.  
It is **not** doing what you think it's doing though.  
<https://powcoder.com>  
Add WeChat powcoder
- Always use `equals` or `equalsIgnoreCase` if you want to compare strings.

## OTHER METHODS

Let `s` be a variable of type `String`. Then some useful methods include:

- `s.length()`

It takes no inputs and returns the number of characters in the `String s`.

<https://powcoder.com>

- `s.charAt(i)`

It takes an integer as input and returns the character in the `String s` which has index equal to `i`. The index determines the position of the character in the `String`. Note that the first character is in position 0.

If in the `String s` there's no character with index `i`, then we will get a run-time error. (`StringIndexOutOfBoundsException`)

## EXAMPLE

Assignment Project Exam Help

```
String s = "Another string";
```

```
System.out.println(s.length());
```

Add WeChat powcoder

What prints?

➤ 14

## EXAMPLE

Assignment Project Exam Help

```
String s = "Another string";  
https://powcoder.com  
System.out.println(s.charAt(2));
```

Add WeChat powcoder

What prints?

## EXAMPLE

### Assignment Project Exam Help

```
String s = "Another string";  
https://powcoder.com  
System.out.println(s.charAt(0) == 'a');
```

Add WeChat powcoder

**What prints?**

➤ false

## REVIEW – METHODS FROM THE STRING CLASS

```
String s = "Review";
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Example – method call	Input type	Return type	Return value
<code>s.equals("review")</code>	String	boolean	false
<code>s.equalsIgnoreCase("review")</code>	String	boolean	true
<code>s.length()</code>	none	int	6
<code>s.charAt(2)</code>	int	char	'v'
<code>s.toLowerCase()</code>	none	String	"review"
<code>s.toUpperCase()</code>	none	String	"REVIEW"

## CONVERTING TYPES WITH STRINGS

You cannot use a cast when converting from a String.

- To convert from `int/double` to a String, just concatenate the number with the empty String `("")`.

```
String s = "" + 4;
```

- To convert from a String to an `int`, use:

```
int x = Integer.parseInt("54");  
String s = "5";  
int y = Integer.parseInt(s);
```

- To convert from a String to a `double`, use:

```
double z = Double.parseDouble("5.4");
```

## TRY IT!

---

1. Write a method that takes a `String` as input and prints `true` if the `String` received is equal to a password (you, the programmer, can choose the password). The method should print `false` otherwise.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

2. Write a method that takes a `String s` and an `int i` as input. The method should return `true` if the character at index `i` is a vowel, `false` otherwise.

# Coming Soon

## Assignment Project Exam Help

In the next video we will be talking about arrays  
and reference types.

<https://powcoder.com>

Add WeChat powcoder
